Focus and Scope

JPI Journal provides writings that are published periodically, and have a purpose as a place to accommodate ideas, studies and studies, as well as an information channel, for the development and development of knowledge in covering the fields of social, education, law, engineering, information technology, communication, government, economics.

Section Policies

Publication Frequency

This journal is published every January 30 and July 30 every year

Open Access Policy

available to the public supports a greater global exchange of knowledge.

By "open access" to this literature, we mean its free availability on the public internet, permitting any users to read, download, copy, distribute, print, search, or link to the full texts of these articles, crawl them for indexing, pass them as data to software, or use them for any other lawful purpose, without financial, legal, or technical barriers other than those inseparable from gaining access to the internet itself. The only constraint on reproduction and distribution, and the only role for copyright in this domain, should be to give authors control over the integrity of their work and the right to be properly acknowledged and cited.

Publication Ethics

Publication Ethics and Malpractice Statement

JPI Journal is a journal aims to be a leading peer-reviewed platform and an authoritative source of information. We publish original research papers, review articles and case studies focused on academics, analysts, practitioners, and those interested in providing literature on Natural Sciences And Social Sciences in all aspects. Related scientific articles, covering the fields of social, education, law, engineering, information technology, communication, government, economics, also not being reviewed for publication anywhere. This following statement clarifies the ethical behavior of all parties involved in the act of publishing an article in this journal, including the author, the editor, the reviewer, and the publisher. This statement is based on COPE's Best Practice Guidelines for journal Editors.

Duties of Authors

1. **Reporting Standards:** Authors should present an accurate account of the original research performed as well as an objective discussion of its significance. Researchers should present their results honestly and without fabrication, falsification or inappropriate data manipulation. A manuscript should contain sufficient detail and references to permit others to replicate the work. Fraudulent or knowingly inaccurate statements constitute unethical behavior and are unacceptable. Manuscripts should follow the submission guidelines of the journal.
2. **Originality and Plagiarism:** Authors must ensure that they have written entirely original work. The manuscript should not be submitted concurrently to more than one publication unless the editors have agreed to co-publication. Relevant previous work and publications, both by other researchers and the authors' own, should be properly acknowledged and referenced. The primary literature should be cited where possible. Original wording taken directly from publications by other researchers should appear in quotation marks with the appropriate citations.
3. **Multiple, Redundant, or Concurrent Publications:** Author should not, in general, submit the same manuscript to more than one journal concurrently. It is also expected that the author will not publish redundant manuscripts or manuscripts describing the same research in more than one journal. Submitting the same manuscript to more than one journal is unacceptable. Multiple publications arising from a single research project should be clearly identified as such and the primary publication should be referred to.
4. **Acknowledgment of Sources:** Authors should acknowledge all sources of data used in the research and cite publications that have been influential in determining the nature of the reported work. Proper acknowledgment of the work of others must always be given.
5. **Authorship of the Paper:** The authorship of research publications should accurately reflect individuals' contributions to the work and its reporting. Authorship should be limited to those who have made a significant contribution to conception, design, execution or interpretation of the reported study. Others who have made significant contribution must be listed as co-authors. In cases where major contributors are listed as authors while those who made less substantial, or purely technical, contributions to the research or to the publication are listed in an acknowledgment section. Authors also ensure that all the authors have seen and agreed to the submitted version of the manuscript and their inclusion of names as co-authors.
6. **Disclosure and Conflicts of Interest:** All authors should clearly disclose in their manuscript any financial or other substantive conflicts of interest that might be construed to influence the results or interpretation of their manuscript. All sources of financial support for the project should be disclosed.
7. **Fundamental Errors in Published Works:** If the author discovers a significant error or inaccuracy in the submitted manuscript, then the author should promptly notify the journal editor or publisher and cooperate with the editor to retract or correct the paper.
8. **Hazards and Human or Animal Subjects:** The author should clearly identify in the manuscript if the work involves chemicals, procedures or equipment that have any unusual hazards inherent in their use.

Duties of Editor

1. **Publication Decisions:** Based on the review report of the editorial board, the editor can accept, reject, or request modifications to the manuscript. The validation of the work in question and its importance to researchers and readers must always drive such decisions. The editors may be guided by the policies of the journal's editorial board and constrained by such legal requirements as shall then be in force regarding libel, copyright infringement and plagiarism. The editors may confer with other editors or reviewers in making this decision. Editors have to take responsibility for everything they publish and should have procedures and policies in place to ensure the quality of the material they publish and maintain the integrity of the published record.
2. **Review of Manuscripts:** Editor must ensure that each manuscript is initially evaluated by the editor for originality. The editor should organize and use peer review fairly and wisely. Editors should explain their peer review processes in the information for authors and also indicate which parts of the journal are peer-reviewed. The editor should use appropriate peer reviewers for papers that are considered for publication by selecting people with sufficient expertise and avoiding those with conflicts of interest.
3. **Fair Play:** The editor must ensure that each manuscript received by the journal is reviewed for its intellectual content without regard to sex, gender, race, religion, citizenship, etc. of the authors. An important part of the responsibility to make fair and unbiased decisions is the upholding of the principle of editorial independence and integrity. Editors are in a powerful position by making decisions on publications, which makes it very important that this process is as fair and unbiased as possible.
4. **Confidentiality:** The editor must ensure that information regarding manuscripts submitted by the authors is kept confidential. Editors should critically assess any potential breaches of data protection and patient confidentiality. This includes requiring properly informed consent for the actual research presented, consent for publication where applicable.
5. **Disclosure and Conflicts of Interest:** The editor of the journal will not use unpublished materials disclosed in a submitted manuscript for his own research without the written consent of the author. Editors should not be involved in decisions about papers in which they have a conflict of interest

Plagiarism Policy

The JPI (Jurnal Penelitian IPTEKS) Journal The editorial board recognizes that plagiarism cannot be calculated and is, therefore, the only part needed for publication in the JPI Journal.

Definition:

Plagiarism involves the "use or close imitation of the language and thoughts of another author and the representation of them as

one's own original work.

Policy:

Papers must be original, unpublished, and not pending publication elsewhere. Any material taken verbatim from another source needs to be clearly identified as different from the present original text by (1) indentation, (2) use of quotation marks, and (3) identification of the source.

Any text of an amount exceeding fair use standards (herein defined as more than two or three sentences or the equivalent thereof) or any graphic material reproduced from another source requires permission from the copyright holder and, if feasible, the original author(s) and also requires identification of the source; e.g., previous publication.

When plagiarism is identified, the Editor in Chief responsible for the review of this paper and will agree on measures according to the extent of plagiarism detected in the paper in agreement with the following guidelines:

Level of Plagiarism

1. Minor:

A short section of another article is plagiarized without any significant data or idea taken from the other paper

Action: A warning is given to the authors and a request to change the text and properly cite the original article is made

2. Intermediate: A significant portion of a paper is plagiarized without proper citation to the original paper

Action: The submitted article is rejected and the authors are forbidden to submit further articles for one year

3. Severe: A significant portion of a paper is plagiarized that involves reproducing original results or ideas presented in another publication

Action: The paper is rejected and the authors are forbidden to submit further articles for five years.

- » By Title
- » Other Journals

FONT SIZE

A₁ A A₂

It is understood that all authors are responsible for the content of their submitted paper as they all sign the JPI JOURNAL Copyright Transfer Form. If a penalty is imposed for plagiarism, all authors will be subject to the same penalty.

If the second case of plagiarism by the same author(s) is identified, a decision on the measures to be enforced will be made by the Editorial board (Editor-in-Chief, and Editorial members) with the Chair of the Editor in Chief. The author(s) might be forbidden to submit further articles forever.

This policy applies also to material reproduced from another publication by the same author(s). If an author uses text or figures that have previously been published, the corresponding paragraphs or figures should be identified and the previous publication referenced. It is understood that in case of a review paper or a paper of a tutorial nature much of the material was previously published.

The author should identify the source of the previously published material and obtain permission from the original author and the publisher. If an author submits a manuscript to JPI Journal with significant overlap with a manuscript submitted to another journal simultaneously, and this overlap is discovered during the review process or after the publications of both papers, the editor of the other journal is notified and the case is treated as a severe plagiarism case. Significant overlap means the use of identical or almost identical figures and identical or slightly modified text for one half or more of the paper. For self-plagiarism of less than one half of the paper but more than one-tenth of the paper, the case shall be treated as intermediate plagiarism. If self-plagiarism is confined to the methods section, the case shall be considered as minor plagiarism.

If an author uses some of his previously published material to clarify the presentation of new results, the previously published material shall be identified and the difference to the present publication shall be mentioned. Permission to republish must be obtained from the copyright holder. In the case of a manuscript that was originally published in conference proceedings and then is submitted for publication in JPI Journal either in identical or in expanded form, the authors must identify the name of the conference proceedings and the date of the publication and obtain permission to republish from the copyright holder. The editor may decide not to accept this paper for publication.

However, an author shall be permitted to use material from an unpublished presentation, including visual displays, in a subsequent journal publication. In the case of a publication being submitted, that was originally published in another language, the title, date and journal of the original publication must be identified by the authors, and the copyright must be obtained. The editor may accept such a translated publication to bring it to the attention of a wider audience. The editor may select a specific paper that had been published (e.g. a "historic" paper) for republication in order to provide a better perspective of a series of papers published in one issue of JPI Journal. This republication shall be clearly identified as such and the date and journal of the original publication shall be given, and the permission of the author(s) and the publisher shall be obtained.

The JPI Journal layout editor for the journal is responsible for maintaining the list of authors subjected to penalties and will check that no authors of a submitted paper are on this list. If a banned author is identified, the layout editor will inform the Editor-in-Chief who will take appropriate measures. This policy will be posted on the web site with the instructions for submitting a manuscript, and a copy will be sent to the authors with the confirmation email upon initial receipt of their original manuscript. A sentence shall be added to the copyright transfer form to indicate that the author(s) have read the Plagiarism Policy.

Author Fees

General Information on JOURNAL PENGABDIAN MASYARAKAT IPTeks Article Processing Charges (APC)

JPI publishes all its journals in full open access, meaning unlimited use and reuse of articles, in addition to giving credit to the authors. All our articles are published under a Creative Commons (CC BY) license.

This journal charges the following author fees.

Article Submission: 0.00 (IDR)

Authors are **NOT** required to pay an Article Processing Charge (Article Submission Fee) as part of the submission process to contribute to review costs.

Article Publication: 300,000.00 (IDR)

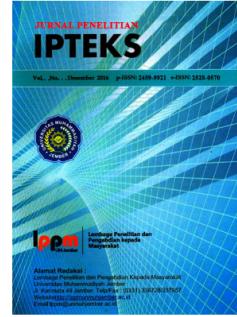

If this paper is accepted for publication, you will be asked to pay an Article Publication Fee to cover publication costs.

Pengaruh Jarak Klem Selang Pada Kuat Tarik Tulangan Bambu

Muhtar*

Universitas Muhammadiyah Jember

e-mail: *muhtar@unmuhjember.ac.id

Diterima: Desember 2020 ; Dipublikasikan Januari 2021

ABSTRAK

Tulangan bambu yang sudah dibentuk biasanya mempunyai permukaan licin hampir 50%. Namun, pada permukaan licin tulangan bambu adalah letak kekuatan serat yang paling tinggi. Tujuan penelitian ini adalah untuk meningkatkan kuat tarik tulangan bambu dengan memasang klem selang pada tulangan bambu. Metode yang digunakan adalah uji *pull-out* tulangan bambu dengan dimensi $15 \times 15 \text{ mm}^2$ yang ditanam pada silinder beton berukuran diameter 150 mm dan tinggi 300 mm. Pengujian dilakukan dengan mesin UTM kapasitas 500 kN. Hasil pengujian menunjukkan bahwa kuat tarik cenderung linier positif seiring dengan meningkatnya jarak pemasangan klem selang. Tulangan bambu dengan *treatment* lapis perekat dan klem selang jarak 5 cm mempunyai kuat tarik tertinggi sampai 400,35% dari tulangan bambu normal. Penggunaan perekat pada tulangan bambu harus dilakukan sebagai lapis kedap air dan mengurangi permukaan licin.

Kata kunci: Tulangan bambu; Kuat tarik; Klem selang

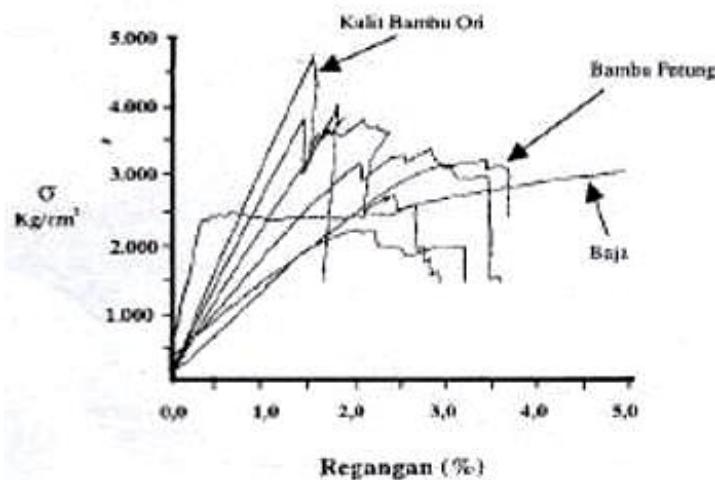

ABSTRACT

Bamboo reinforcement that has been formed usually has a smooth surface of almost 50%. However, on the slippery surface of bamboo reinforcement is the location of the highest-fiber strength. This study aimed to increase the tensile strength of bamboo reinforcement by installing hose clamps on bamboo reinforcement. The method used is a pull-out test of bamboo reinforcement with dimensions of $15 \times 15 \text{ mm}^2$ which is planted in a concrete cylinder size 150 mm in diameter and 300 mm in height. The test was carried out with a UTM machine with a capacity of 500 kN. The test results show that the tensile strength tends to be positive linear as the distance between the hose clamps is increased. Bamboo reinforcement with adhesive layer treatment and hose clamps at a distance of 5 cm has the highest tensile strength of up to 400.35% of normal bamboo reinforcement. The use of adhesive on bamboo reinforcement must be done as a waterproof layer and reduce slippery surfaces.

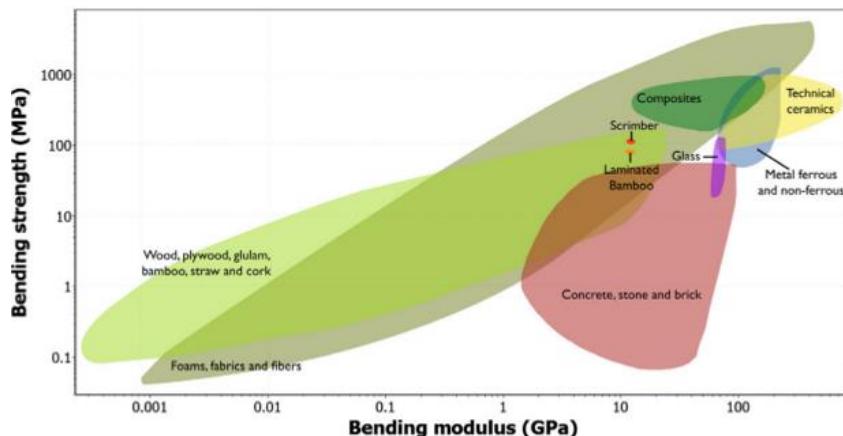

Keywords: Bamboo reinforcement; tensile strength; Hose Clamp

PENDAHULUAN

Penggunaan bambu sebagai bahan bangunan konstruksi telah banyak digunakan oleh masyarakat pedesaan, seperti konstruksi rumah tinggal sederhana, rangka jembatan semi permanen, konstruksi rangka gudang, konstruksi turap pada saluran irigasi, dan sebagainya. Bahkan penggunaan bambu sebagai material alternatif pengganti tulangan baja dalam konstruksi beton telah banyak dilakukan oleh peneliti, diantaranya Ghavami (2005), Dewi & Nuralinah (2017), Mali & Datta (2020), Kathiravan et al. (2020), Muhtar et al. (2019), dan lain-lain. Alasan bambu digunakan sebagai material alternatif tulangan baja karena kuat tariknya yang cukup tinggi. Beberapa hasil penelitian menyatakan bahwa bambu memiliki kekuatan tarik yang tinggi mendekati tulangan baja sebagaimana Gambar 1 (Morisco, 1999), sehingga dapat digunakan sebagai tulangan beton. Ghavami (2005) menyebutkan kekuatan tarik bambu yang relatif tinggi dapat mencapai 370 MPa. Keuntungan lain dari bambu adalah kekuatan lentur dengan rasio kepadatannya. Gambar 2 memperlihatkan bahwa kuat lentur bambu laminasi lebih tinggi dari beton maupun bahan komposit alami lainnya (Sharma et al., 2015). Selain itu, kebutuhan energi yang digunakan untuk menghasilkan baja 50 kali lebih besar daripada bambu, sehingga bambu merupakan salah satu material yang ekonomis dan lebih ramah terhadap lingkungan.

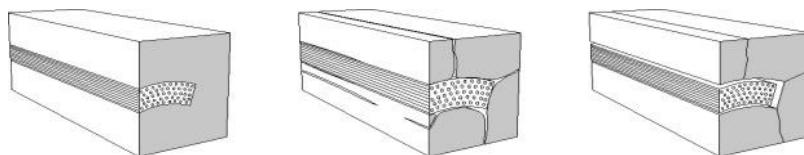

Gambar 1. Diagram Tegangan Regangan Tulangan Baja dan Bambu (Morisco, 1999)

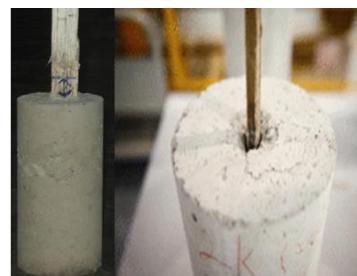

Gambar 2. Modulus lentur vs kuat lentur untuk macam-macam bahan konstruksi (Sharma et al., 2015)

Bambu untuk dapat digunakan sebagai tulangan beton, harus direndam, dikeringkan, dan dilapisi dengan lapisan kedap air (*waterproof*) seperti cat kayu, epoxi, melamin, vernis, dan lain-lain. Hal ini dimaksudkan untuk menghalangi terjadinya saling menyerap air antara bambu dan beton. Penyerapan air terjadi dua tahap. Tahap pertama waktu beton basah. Air beton basah diserap oleh bambu yang bersifat hygrokopis dan menyebabkan bambu mengembang (*swelling*). **Gambar 3** menunjukkan masalah mengembangnya tulangan bambu tanpa *treatment* dalam beton. Pada tahap kedua sesudah beton mengeras, air yang ada dibambu diikat oleh molekul semen di dalam beton. Proses ini disebut proses *hydrolisis* yang berlangsung sampai waktu tak terhingga. Dengan demikian jika bambu tidak dilapisi dengan lapisan kedap air maka bambu yang semula banyak mengandung air lama kelamaan akan mengecil karena air bambu diikat oleh beton. **Javadian et al.**, (2016) melakukan penelitian uji *pull-out* tulangan bambu yang diberi beberapa jenis lapisan epoxy dan pasir untuk menentukan perilaku ikatan antara beton dan tulangan bambu-komposit. Hasil penelitiannya menunjukkan bahwa tulangan bambu-komposit tanpa lapisan ikatan cukup memadai dengan matriks beton, namun dengan lapisan dasar epoxy dan partikel pasir bisa memberikan perlindungan ekstra tanpa kehilangan kekuatan ikatan. Oleh karena itu pemberian lapisan kedap air dan pelburan pasir mutlak diperlukan.

Gambar 3. Pembengkakan tulangan bambu dalam beton, retak mikro, dan ekspansi tulangan bambu ([Javadian et al.](#), (2016)

Gambar 4. Pola keruntuhan slip pada silinder beton ([Agarwal et al.](#), 2014 dan [Javadian et al.](#), (2016)

Beberapa penelitian tentang kuat tarik dan kuat lekat tulangan bambu yang telah ditreatment dengan metode uji *pull-out* diantaranya [Ghavami](#) (2005), [Agarwal et al.](#) (2014), [Nindyawati et al.](#) (2013), [Dey & Chetia](#) (2016), dan [Sakaray et al.](#) (2012). Dari hasil penelitian yang telah dilakukan oleh beberapa peneliti menunjukkan bahwa kuat tarik dan kuat lekat meningkat, namun masih menunjukkan pola keruntuhan slip sebagaimana diperlihatkan pada **Gambar 4**. Hal ini menunjukkan kuat tarik dan kuat lekat tulangan bambu dan beton belum maksimal. Oleh karena itu, penelitian ini bertujuan meningkatkan kuat tarik dan kuat lekat tulangan bambu dan beton. Hipotesis penelitian ini adalah diduga pelaburan lapis kedap air, pelaburan pasir, dan pemasangan klem selang dapat meningkatkan kuat tarik maupun kuat lekat antara tulangan bambu dan beton.

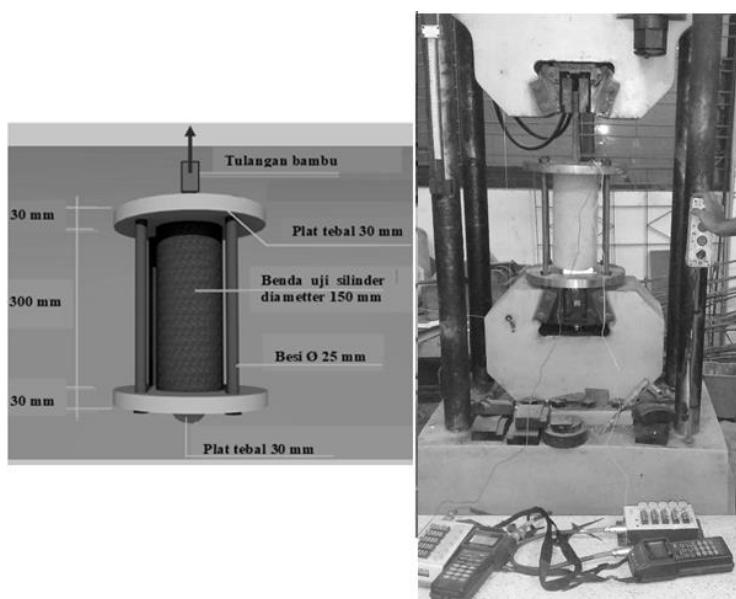

METODE PENELITIAN

Uji cabut dilakukan pada tulangan bambu dengan dimensi 15 mm x 15 mm x 400 mm yang ditanam pada silinder beton sedalam 200 mm. Silinder beton berukuran diameter 150 mm dan tinggi 300 mm. Tulangan bambu ditanam pada titik pusat silinder. Proporsi campuran beton normal yang digunakan adalah semen portland pozzoland, pasir, agregat kasar, dan air dengan proporsi 1 PPC : 2 Ps : 3 Kr. Pengujian dilakukan dengan mesin UTM kapasitas 500 kN setelah silinder beton berumur 28 hari dari pengecoran. Pengujian uji cabut tulangan bambu mengikuti [Ghavami](#) (2005) dan [Muhtar et al.](#) (2019) yaitu menggunakan metode *Conventional pull-out test*.

Rancangan eksperimen uji cabut terdiri dari 6 perlakuan yang terdiri dari: (1) tulangan normal, (1) tulangan dengan klem-selang jarak 100 mm, (3) tulangan dengan Sikadur®-752, (4) tulangan dengan klem-selang jarak 5 mm + Sikadur®-752, (5) tulangan dengan klem-selang jarak 15 mm + Sikadur®-752, dan (6) tulangan dengan klem-selang jarak 20 mm + Sikadur®-752. Bentuk benda uji tulangan bambu ditunjukkan pada **Gambar 5**. Detail dan pengaturan uji *pull-out* dapat dilihat pada **Gambar 6**.

Gambar 5. Tulangan bambu dengan *treatment* pelaburan perekat, pelaburan pasir, dan klem selang

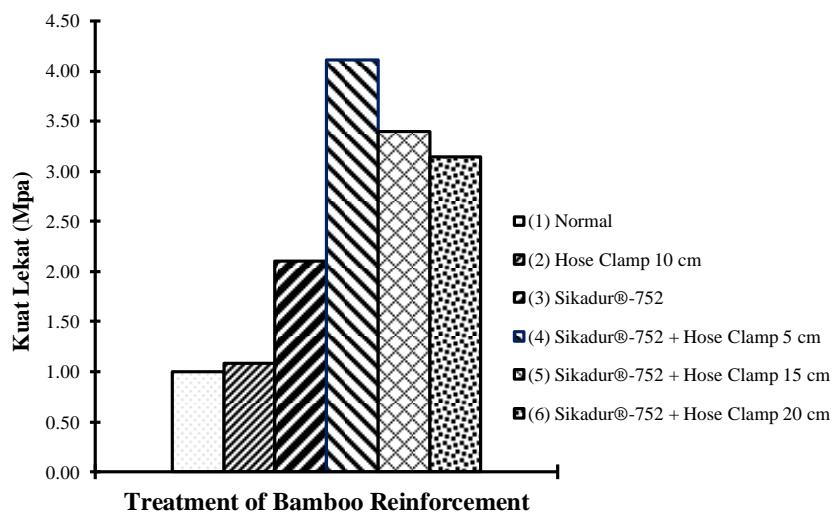

Gambar 6. Pengaturan uji *pull-out* tulangan bambu

HASIL DAN PEMBAHASAN

Uji kuat lekat tulangan bambu yang tertanam pada silinder beton menggunakan mesin *Universal Testing Machine* (UTM) berkapasitas 1000 kN. Dari data hasil uji *pull-out* tulangan bambu dengan perlakuan pelaburan perekat sikadur®-752, pasir, dan bercincin klem-selang yang tertanam pada silinder beton menunjukkan peningkatan tegangan lekat sebesar 400,35%, 240%, dan 214% dari bambu tanpa perlakuan dengan jarak klem-selang berturut-turut 5 cm, 15 cm, dan 20 cm. Untuk tulangan bambu tanpa pelaburan perekat sikadur®-752 dan pasir, dengan klem-selang dengan jarak 10 cm meningkat sebesar 8%. Sedangkan tulangan bambu dengan pelaburan perekat Sikadur®-752 dan pasir tanpa menggunakan klem-selang meningkat sebesar 150% seperti yang diperlihatkan pada Tabel 1 dan Gambar 7.

Benda uji dengan tulangan bambu yang diberi perekat sikadur®-752, pelaburan pasir, dan klem-selang menunjukkan pola keruntuhan lekatan dan prisma beton (*bond and concrete cone failure*) dan keruntuhan batang bambu (*Bamboo failure of node*) sebagaimana ditunjukkan pada Gambar 8(b) dan Gambar 8(c). Hal ini menunjukkan adanya efek perekat Sikadur®-752 dan klem-selang pada tulangan bambu telah bekerja dengan baik, yang ditunjukkan dengan melekatnya beton pada tulangan bambu. Benda uji dengan perekat Sikadur®-752 dan pasir menunjukkan keruntuhan geser-lekat (*bond-slip failure*), namun mempunyai kuat lekat yang cukup tinggi seperti yang ditunjukkan

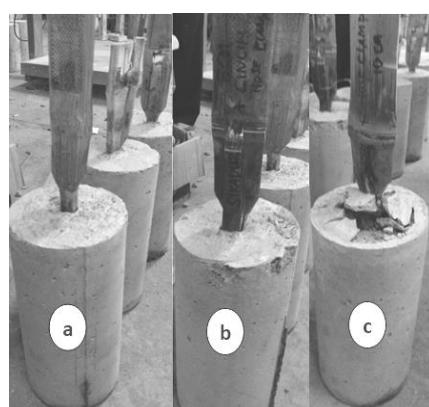

pada [Gambar 8\(a\)](#). Sedangkan benda uji dengan klem-selang tanpa perekat mengalami keruntuhan geser-lekat (*bond-slip failure*) dengan kuat lekat hampir sama dengan tulangan bambu tanpa perlakuan, pola keruntuhan ditunjukkan pada [Gambar 8\(a\)](#).

Gambar 7. Kuat lekat tulangan bambu uji *pull-out*

Gambar 8. Pola keruntuhan silinder beton uji *pull-out* tulangan bambu

Dari analisa hasil uji dan pola keruntuhan, menunjukkan penggunaan perekat atau lapis kedap air mutlak harus dilakukan, sedangkan pemasangan klem-selang pada tulangan bambu tanpa perekat atau lapis kedap air tidak mempunyai pengaruh yang nyata.

KESIMPULAN

Treatment tulangan bambu dengan perekat sikadur®-752, pasir, dan klem-selang menunjukkan peningkatan kuat lekat dan kuat tarik tulangan bambu. Pemasangan klem selang tanpa perekat tidak mempunyai pengaruh yang nyata. Pelaburan perekat dan pasir pada tulangan bambu mutlak harus dilakukan. Tulangan bambu dengan perlakuan pelaburan perekat sikadur®-752, pasir, dan bercincin klem-selang yang tertanam pada silinder beton menunjukkan peningkatan tegangan lekat sebesar 400,35%, 240%, dan 214% dari bambu tanpa perlakuan dengan jarak klem-selang berturut-turut 5 cm, 15 cm, dan 20 cm. *Treatment* perekat sikadur®-752, pelaburan pasir, dan klem-selang menunjukkan pola keruntuhan “*bond and concrete cone failure*” dan “*Bamboo failure of node*”. Benda uji dengan perekat Sikadur®-752 dan pasir maupun tanpa *treatment* menunjukkan keruntuhan “*bond-slip failure*”.

UCAPAN TERIMA KASIH

Terima kasih disampaikan kepada LPPM Universitas Muhammadiyah Jember dan DRPM Republik Indonesia selaku penyandang dana Program Pengabdian kepada Masyarakat (PPM) Kementerian Pendidikan, Kebudayaan, Riset, dan Teknologi Republik Indonesia 2021.
