GREETING MESSAGE

Bismillahirrohmanirrohim Assalamualaikum Wr Wb Good morning and best wishes

The Honorable, Rector of University of Jember
The Honorable, Dean Faculty of Nursing, University of Jember
The Honorable, All Speaker of the International Nursing Conference
The Honorable, Guests
The Honorable, Conference Committee
Dear All, All Participants of the conference

Thank God we praise the presence of Allah SWT, because of the blessing and grace, we all can be present in this place, in order to attend the International Nursing Conference. Solawat and greetings may still be delegated to the Great Prophet Muhammad SAW.

Ladies and Gentlemen,

As the beginning of this speech, I would like to say welcome to the third international nursing conference, with the theme " Optimizing the Role of Nursing and Health Professionals to Enhance the Health Care Quality in the New Normal Era".

In the era of globalization, nursing and healthcare are affected in a unique way. Although the important tenets of health remain unchanged, the evolutions of nursing knowledge are far beyond than previously thought to be. The advancement of technology has enabled human to find more curative possibilities and the latest in nursing process or medical therapy. Nevertheless, more work needs to be done due to new challenges in the era of industrial revolution and unstable economic climate. A more comprehensive approach is needed in order to adapt and improve the healthcare system. Today, health is not only the absence of illness but also the presence of wellness especially in the New Normal Era of COVID 19.

4th IANC 2020 aims to enhance health care quality amongst healthcare professional, scientist, practitioners and students by being a platform to share and disseminate knowledge, updates, research findings and experience for the benefit of mankind.

4th IANC 2020 will focus on multiple range of topics in nursing, medicine, surgery, science, health management and alternative medicine. It will include but not limited to these major areas: 1). Nursing: Medical and surgical nursing (Adult), Emergency and critical nursing, Gerontological nursing, Community nursing, Family health nursing, Mental health nursing, Pediatric nursing, Maternity nursing, Nursing leadership and management, Complementary and Alternative Medicine (CAM) in nursing, Education in nursing. 2). Clinical Sciences: Dentistry, pharmacology, toxicology, immunology, medical and surgical nursing. 3). Health sciences Nutrition, population health, community health, epidemiology and health prevention, biostatics.

To answer that question on November 26, 2020, we will discuss enhance the Health Care Quality in the New Normal Era with speakers from 5 countries namely:

1. Prof. Rozzano Locsin, Ph.D, RN, FAAN (Tokushima University, Japan)

- 2. Prof. Lin Perry, RN., MSc., Ph.D (University of Technology Sydney, Australia)
- 3. Assist. Prof. Dr. Samoraphop Banharak (Khon Kaen University, Thailand)
- 4. Dr Jane Brooks, PhD, RN SFHEA (The University of Manchester, UK)
- 5. Ns. Anisah Ardiana, M.Kep., PhD (Faculty of Nursing, Universitas Jember, Indonesia)

Ladies and Gentlemen

This conference is attended by students, health department delegates, academics, hospital and community clinic practitioners with a total of 350 participants.

This event can be held because of the support and efforts of all parties. Therefore, I would like to thank the Rector of University of Jember, Head of School of Nursing- University of Jember, Indonesian National Nurses Association (INNA) or PPNI, and all the committees who have worked hard to carry out this activity. I also thank to the sponsors who have worked with us so that this event run as expected. Amen.

We as the committee, apologize if there is any inconvenience during this event. Our hope that this activity can increase our knowledge that benefits all of us. Amen.

Before I end my speech, I want to say "when we interpret that today is an ordinary day, then we will come out of this room as an ordinary people, but when we interpret that today is a very extraordinary day, then we will come out of this room as a very wonderful person ". Finally, please enjoy this conference, may Allah SWT always gives blessings to all of us. Amen

Wassalamualaikum Wr. Wb.

Chairperson

Ns. Kholid Rosyidi Muhammad Nur, MNS

RISK ANALYSIS OF THE OCCUPATIONAL AND HEALTH SAFETY USING HAZARD IDENTIFICATION, RISK ASSESSMENT AND RISK CONTROL (HIRARC) METHOD IN THE UNIVERSITY OF MUHAMMADIYAH JEMBER

Dwi Yunita Haryanti

Nursing Management, Faculty of Health Science, University of Muhammadiyah Jember, Indonesia Corresponding Author: dwiyunita@unmuhjember.ac.id

ABSTRACT

Background: University of Muhammadiyah Jember has the potential and risk of dangers, so the launching of the Occupational and Health Safety program in this office area is something that needs to be carried out, in order to create a healthy, safe and comfortable office and the realization of healthy, safe, fit, performing and productive employees. Hazard Identification, Risk Assessment and Risk Control is one of the ways to identify potential dangers in any kind of job activities. Purpose: This research is held to analyze the risk of work accident by using HIRARC method. **Methods:** This research uses descriptive qualitative research method. The qualitative method is used to describe the condition, to identify and recognize the work accident analysis. Results: The findings show that hazard in the job activity is identified as chemical, mechanical, physical, electrical, ergonomic, biological, psychosocial and environmental hazards. The risk assessment which is held denotes that there are 6 high risk, 13 medium risk and 4 low risk. Conclussion: Risk control that can be applied are engineering controls, administrative and personal protective equipment to reduce unsafe action and unsafe condition. HIRARC method which has beed applied at the University of Muhammadiyah Jember proves that work activities in the office has a risk that should be controlled.

Keywords: Occupational and Health Safety; HIRARC; Work Accident; Office

BACKGROUND

Occupational and Health Safety in the office is occupational safety and health in the office area are all activities to ensure and protect the safety and health of employees through efforts to prevent occupational accidents and diseases due to work in the office (PMK, 2016). The government's goal of launching OHS in office areas is

to create a healthy, safe and comfortable office for the creation of healthy, safe, fit, performing and productive employees.

Data from the Central Statistics Agency in 2018 stated that the total workforce was 133.94 million, 127.07 million people working in the formal and informal sectors, while 6.87 million others were unemployed. Among them are formal workers in the industrial and office sectors. Based on exposure to hazard risks, the industrial sector will be exposed to mild to severe potential hazards, while the office sector is exposed to mild to moderate potential hazards.

In this era, occupational safety and health is a must for work organizers to increase productivity. The maintenance of good occupational health will minimize the number of morbidity, absenteeism, disabilities and work accidents, so that healthy and productive workers will be realized. Work accidents in the office sector can occur as a result of several potential hazards in the work environment, including physical, chemical, biological, ergonomic, psychosocial, mechanical, electrical, waste and disaster hazards.

Potential hazards in the work environment can be identified by using the HIRARC (Hazard Identification, Risk Assessment and Risk Analysis) method. HIRARC is a process of determining the priority of occupational accident risk level control so that it can classify the potential hazards into high, medium and low risks. This process will later facilitate the evaluation process (Department of Occupational Safety and Health, 2008).

Riskesdas 2018 data states that the prevalence of non-communicable diseases has increased if it compared to 2013. These diseases include cancer, stroke, chronic kidney disease, diabetes mellitus and hypertension. The increase of non-communicable diseases is related to lifestyle, such as smoking, alcoholic drinking, inadequate physical activity, and minimal consumption of vegetables and fruits. Increasing the level of education and professional workers in Indonesia will increase the number of office workers. Sedentary behavior or lack of physical activity is synonymous with office workers. Therefore, increasing the implementation of occupational safety and health in each institution or agency is something that must be developed and improved (Presidential Instruction No.1, 2017).

Until now, University of Muhammadiyah Jember has not conducted a risk analysis yet, so that the researcher is interested in conducting risk analysis to determine the potential hazards of office workers and its control plan. The OHS risk analysis uses the HIRARC method which is expected to be able to control the existing risks, so that the healthy, fit and productive workers in providing services also can be expected.

METHODS

This research used a qualitative method with a descriptive design. The work area chosen is a work area that has a potential hazard. The main informants of this research are the main leaders, represented by the head of the quality assurance agency, the head of the bureau, the dean, the head of the laboratory, the laboratory assistant and the head of security. Informants were selected by using purposive sampling. Sources of data in this research are primary data and secondary data. Primary data were obtained through interviews and observations by using the HIRARC method. Secondary data were obtained from study of supporting documents.

RESULTS

Hazard Identification

The first stage of HIRARC is hazard identification. The results of hazard identification at the University of Muhammadiyah Jember are presented in the following table:

Table 1. Hazard Identification of the General Administration Unit in the University of Muhammadiyah Jember

No	PROCESS	HAZARD	RISK	CONSEQUENCES
1	Sweeping (floor)	- Dust - Un ergonomic broom	- Inhaled - Contact with mucosa membrane (eyes, node and mouth) - Fatigue	 Respiratory dissorder Konjungtivitis Irritation Low back pain and the joints

RISK ASSESSMENT

Risk assessment is carried out to evaluate the amount of risk and impact that will be caused. The results of the risk assessment at the work unit at the University of Muhammadiyah Jember are as follows:

Table 4. Risk Assessment of the General Administration Unit in the University of Muhammadiyah Jember

DISCUSSION

The results of hazard identification in the work unit of the general administration, laboratories and personnel unit at Muhammadiyah University of Jember stated that there were sources of danger in the types of chemical, mechanical, physical, electrical, ergonomic, biological, psychosocial and environmental. This is in accordance with Baskoro's research (2015) which states that there are types of hazards in the form of physical, chemical, ergonomic and psychosocial hazards at the Faculty of Health, University of Indonesia. Physical, chemical and biomechanical hazards related to ergonomics (Permenkes No 48, 2016).

Potential hazards in offices include chemical hazards which is found to be potentially exposed to staff working in laboratories as well as cleaners, namely detergents, disinfectants, dust from markers and corrosive tools and some chemical reagents. Chemicals continuously used causing irritation, intoxication, diseases of the skin, eyes and respiratory tract. As port d'entree is toxic to the human body in three ways, namely inhalation, digestion and skin (Sujoso, 2012). Storage of reagents in a laboratory that is not standardized, does not have a Material Safety Data Sheet (MSDS) is also a risk of unwanted things, such as explosion and fire. Making SOP and labeling of each chemical with MSDS is very necessary to avoid undesirable things. The controls which is carried out to reduce potential hazards and risks are engineering control, administrative control and the use of appropriate PPE (Kumara, 2019).

The mechanical hazards were found in lawn mowers, stairs and floors. Open mower has potential hazard for worker, where the blade can come off and injure the worker. Slippery floors and stairs and safety rubber on stairs can be source of mechanical hazards.

The activity of going up and down stairs is a physical activity that is commonly carried out by all staff and is considered to be healthier. This is in accordance with Suwarni and Ramadhani's research, 2019 which states that the activity of going up and down stairs can support body fitness. However, some stairs are not in accordance with safety standards so that there is a potential for fatigue and accidents (near miss). To reduce and avoid this incident, the stairs must be made as comfortable as possible in accordance with existing standards, because ideally when the stairs are passed by the user, they will not feel difficult or tired (Saputra, 2020).

Physical hazards are potential hazards that cause health problems for exposed workers (Sujoso, 2012). In the office world, radiation exposure from computer use has the potential to be an actual risk. Based on the results of the interview, it was found that eye disorders were common among both administrative staff and lecturers as a

result of prolonged computer use. The effect of the length of exposure to this monitor also plays a major role in existing complaints. This is in line with research by Bhanderi et.al which states that someone who works in front of a computer screen> 4 hours continuously has a 26-fold risk of suffering from Computer Vision Syndrome (CVS) compared to individuals who also work in front of a computer screen for <4 hours continuously.

The daytime break is used only for prayer and lunch then returning to work in front of computer screen. The demands of work lead to a reduced frequency of eye breaks, so multiple short breaks are more efficient than one-time long breaks. Responding to this problem, the American Academy of Opthalmology provides tips to avoid eye distraction while working, including installing a screen protector to reduce glare, follow the 20-20-20 rule, which is every 20 minutes of work, shift your view from the monitor to an object 20 feet away (six meters) for 20 seconds.

Office areas cannot be separated from electrical equipments. Electrical hazard signals result from electric currents and sparks or short circuits. Fire problems are often based on short circuits, human errors, flammable materials and inaccurate selection of electrical installation equipment (Hambaly, Setiawati, & Majid, 2018)

Ergonomic hazards based on the risk assessment and existing staff, are found in the form of fatigue when carrying goods from the 1st floor to 4th floor or vice versa. Complaints of back pain, shoulder and sprains / dislocations are the most common complaints caused by this activity. In some rooms, there are complaints in the form of a table mismatch with chairs, tables that are too high and chairs that cannot adjust, causing fatigue in the limbs involved (hands, arms, back and legs). Sitting and typing for a long time and manual handling can cause musculoskeletal disorders, such as low back pain. This is in accordance with the results of research conducted by Dewi (2017) that unnatural work posture for a long time will cause complaints of pain in body parts, fatigue, product defects and even physical defects.

The biological hazard that occurs as a result of contact with body fluids is needle stick injury which can be a big problem if the used needle contains pathogenic microorganisms, such as hepatitis or HIV. The most staffs at risk here are laboratory assistants in the nursing laboratory. Another biological hazard is air pollution, where the exposure comes from rooms that use air conditioning. Non-routine air conditioning treatment will cause the air to contain microorganisms and cause respiratory diseases, such as work-related asthma (Sujoso, 2012). The presence of vector animals (cockroaches and rats) as well as cats in the work area will also affect the cleanliness and health of workers. The identified psychosocial hazards are the setting of working and rest hours which are actually in accordance with standards, but it has not applicated yet, especially the extra attention for night shift workers related to the schedule of changing shifts. Workload exceeds the work capacity of some staff will cause decreased or poor work performance. Work done in a monotonous manner will also lead to boredom, which in turn leads to a decrease in worker productivity. Researcher's recommendations related to psychosocial hazards are reviewing work hours and rest time arrangements, reviewing work productivity, dividing work in order the workload is evenly distributed among all staff so that no one feels the burden is heavier than others and provides education to workers regarding safety and occupational health (Simbolon, 2018).

Environmental hazards at Muhammadiyah University of Jember exist in several work units located on the 4th floor, where the height is a source of danger that affects musculoskeletal disorders. Working at a height requires preventive action so that all work activities can be carried out safely, so risk management / risk management is

needed (HSE, 2017). To avoid musculoskeletal disorders, workers should pay attention to posture when going up and down stairs.

Based on the results of the risk assessment, there are 6 high-risk activity processes, 13 medium-risk activity processes and 4 low-risk activity processes. Evaluation needs to be done whether the existing risk is acceptable or not, referring to the risk criteria established by the management of the organization. Acceptable risk is often termed as low as reasonably practicable, where the lowest level of risk is reasonable (Ramli, 2013). The risks are found within acceptable limits, so control measures must be taken.

The risk control is carried out for all hazards which are found in the hazard identification process by considering the risk ratings to determine the control priorities. Possible risk controls are engineering, administrative and personal protective equipment. This is in line with the theory of risk control that needs to be done to minimize and / or eliminate the risk of work accidents through the stages of elimination, substitution, engineering, administrative and personal protective equipment (Ramli, 2013).

CONCLUSION

Hazard identification in 11 activity processes in the general administration unit are found 21 potential hazards. In the laboratory unit, there are 6 activity processes with 11 potential hazards and in the personnel unit, 6 activity processes with 9 potential hazards are found.

There is the risk assessment in the work unit of the general administration division with a risk rating of 16, which is the activity of maintaining security in the campus environment that inherent in security duties. The highest risk rating with a value of 12 in laboratory units is found in nursing laboratories, namely in the process of preparing practicum activities using sharp tools / objects. While the risk assessment in the personnel unit, the highest risk rating with a value of 12 was found in working in the room using air conditioning and also in writing / typing on computers.

Risk control is determined based on the risk categories. The red zone is a high risk that must be controlled by eliminating the risk of hazards. Yellow zone where the risk is acceptable if security has been implemented and the green zone does not need control, but still adheres to SOP and the use of personal protective equipment. Implementing a work safety and health system that has been accommodated in Permenkes No. 48 of 2016 concerning office safety and health standards, including occupational safety, occupational health, office work environment health and office ergonomics.

RISK ANALYSISOF THE OCCUPATIONAL AND HEALTH SAFETY USING HAZARD IDENTIFICATION, RISK ASSESSMENT AND RISK CONTROL (HIRARC) METHOD IN THE UNIVERSITY OF MUHAMMADIYAH JEMBER

Dwi Yunita Haryanti

Nursing Management, Faculty of Health Science, University of Muhammadiyah Jember, Indonesia Corresponding Author: dwiyunita@unmuhjember.ac.id

ABSTRACT

Background: University of Muhammadiyah Jember has the potential and risk of dangers, so the launching of the Occupational and Holth Safety program in this office area is something that needs to be carried out, in order to create a healthy, safe and comfortable office and the realization of healthy, safe, fit, performing and productive employees. Hazard Identification, Risk Assessment and Risk (3) ntrol is one of the ways to identify potential dangers in any kind of job activities. **Purpose:** This researsh is held to analyze the risk of work accident by using HIRARC method. **Methods:** This research uses descriptive qualitative research method. The qualitative method is used to describe the condition, to identify and recognize the work accident analysis. Results: The findings show that hazard in the job activity is identified as chemical, mechanical, physical, electrical, ergonomic, biological, psychosocial and environmental hazards. The risk assessment which is held denotes that there are 6 high risk, 13 medium risk and 4 low risk. Conclussion: Risk control that can be applied are engineering controls, administrative and personal protective equipment to reduce unsafe action and unsafe condition. HIRARC method which has beed applied at the University of Muhammadiyah Jember proves that work activities in the office has a risk that should be controlled.

Keywords: Occupational and Health Safety; HIRARC; Work Accident; Office

BACKGROUND

2

Occupational and Health Safety in the office is occupational safety and health in the office 2 ea are all activities to ensure and protect the safety and health of employees through efforts to prevent occupational accidents and diseases due to work in the office (PMK, 2016). The government's goal of launching OHS in office areas is

to create a healthy, safe and comfortable office for the creation of healthy, safe, fit, performing and productive employees.

Data from the Central Statistics Agency in 2018 stated that the total workforce was 133.94 million, 127.07 million people working in the formal and informal sectors, while 6.87 million others were unemployed. Among them are formal workers in the industrial and office sectors. Based on exposure to hazard risks, the industrial sector will be exposed to mild to severe potential hazards, while the office sector is exposed to mild to moderate potential hazards.

In this era, occupational safety and health is a must for work organizers to increase productivity. The maintenance of good occupational health will minimize the number of morbidity, absenteeism, disabilities and work accidents, so that healthy and productive workers will be realized. Work accidents in the office sector can occur as a result of several potential hazards in the work environment, including physical, chemical, biological, ergonomic, psychosocial, mechanical, electrical, waste and disaster hazards.

Potential hazards in the work environment can be identified by using the HIRARC (Hazard Identification, Risk Assessment and Risk Analysis) method. HIRARC is a process of determining the priority of occupational accident risk level control so that it can classify the potential hazards into high, medium and low risks. This process will later facilitate the evaluation process (Department of Occupational Safety and Health, 2008).

Riskesdas 2018 data states that the prevalence of non-communicable diseases has increased if it compared to 2013. These diseases include cancer, stroke, chronic kidney disease, diabetes mellitus and hypertension. The increase of non-communicable diseases is related to lifestyle, such as smoking, alcoholic drinking, inadequate physical activity, and minimal consumption of vegetables and fruits. Increasing the level of education and professional workers in Indonesia will increase the number of office workers. Sedentary behavior or lack of physical activity is synonymous with office workers. Therefore, increasing the implementation of occupational safety and health in each institution or agency is something that must be developed and improved (Presidential Instruction No.1, 2017).

Until now, University of Muhammadiyah Jember has not conducted a risk analysis yet, so that the researcher is interested in conducting risk analysis to determine the potential hazards of office workers and its control plan. The OHS risk analysis uses the HIRARC method which is expected to be able to control the existing risks, so that the healthy, fit and productive workers in providing services also can be expected.

METHODS

This research used a qualitative method with a descriptive design. The work area chosen is a work area that has a potential hazard. The main informants of this research are the main leaders, represented by the head of the quality assurance agency, the head of the bureau, the dean, the head of the laboratory, the laboratory assistant and the head of security. Informants were selected by using purposive sampling. Sources of data in this research are primary data and secondary data. Primary data were obtained through interviews and observations by using the HIRARC method. Secondary data were obtained from study of supporting documents.

RESULTS

Hazard Identification

The first stage of HIRARC is hazard identification. The regults of hazard identification at the University of Muhammadiyah Jember are presented in the following table:

Table 1. Hazard Identification of the General Administration Unit in the University of Muhammadiyah Jember

RISK ASSESSMENT

Risk assessment is carried out to evaluate the amount of risk and impact that will be caused. The results of the risk assessment at the work unit at the University of Muhammadiyah Jember are as follows:

DISCUSSION

The results of hazard identification in the work unit of the general administration, laboratories and personnel unit at Muhammadiyah University of Jember stated that there were sources of danger in the types of chemical, mechanical, physical, electrical, ergonomic, biological, psychosocial and environmental. This is in accordance with Baskoro's research (2015) which states that there are types of hazards in the form of physical, chemical, ergonomic and psychosocial hazards at the Faculty of Health, University of Indonesia. Physical, chemical and biomechanical hazards related to ergonomics (Permenkes No 48, 2016).

Potential hazards in offices include chemical hazards which is found to be potentially exposed to staff working in laboratories as well as cleaners, namely detergents, disinfectants, dust from markers and corrosive tools and some chemical reagents. Chemicals continuously used causing irritation, intoxication, diseases of the skin, eyes and respiratory tract. As port d'entree is toxic to the human body in three ways, namely inhalation, digestion and skin (Sujoso, 2012). Storage of reagents in a laboratory that is not standardized, does not have a Material Safety Data Sheet (MSDS) is also a risk of unwanted things, such as explosion and fire. Making SOP and labeling of each chemical with MSDS is very necessary to avoid undesirable things. The controls which is carried out to reduce potential hazards and risks are engineering control, administrative control and the use of appropriate PPE (Kumara, 2019).

The mechanical hazards were found in lawn mowers, stairs and floors. Open mower has potential hazard for worker, where the blade can come off and injure the worker. Slippery floors and stairs and safety rubber on stairs can be source of mechanical hazards.

The activity of going up and down stairs is a physical activity that is commonly carried out by all staff and is considered to be healthier. This is in accordance with Suwarni and Ramadhani's research, 2019 which states that the activity of going up and down stairs can support body fitness. However, some stairs are not in accordance with safety standards so that there is a potential for fatigue and accidents (near miss). To reduce and avoid this incident, the stairs must be made as comfortable as possible in accordance with existing standards, because ideally when the stairs are passed by the user, they will not feel difficult or tired (Saputra, 2020).

Physical hazards are potential hazards that cause health problems for exposed workers (Sujoso, 2012). In the office world, radiation exposure from computer use has the potential to be an actual risk. Based on the results of the interview, it was found that eye disorders were common among both administrative staff and lecturers as a

result of prolonged computer use. The effect of the length of exposure to this monitor also plays a major role in existing complaints. This is in line with research by Bhanderi et.al which states that someone who works in front of a computer screen> 4 hours continuously has a 26-fold risk of suffering from Computer Vision Syndrome (CVS) compared to individuals who also work in front of a computer screen for <4 hours continuously.

The daytime break is used only for prayer and lunch then returning to work in front of computer screen. The demands of work lead to a reduced frequency of eye breaks, so multiple short breaks are more efficient than one-time long breaks. Responding to this problem, the American Academy of Opthalmology provides tips to avoid eye distraction while working, including installing a screen protector to reduce glare, follow the 20-20-20 rule, which is every 20 minutes of work, shift your view from the monitor to an object 20 feet away (six meters) for 20 seconds.

Office areas cannot be separated from electrical equipments. Electrical hazard signals result from electric currents and sparks or short circuits. Fire problems are often based on short circuits, human errors, flammable materials and inaccurate selection of electrical installation equipment (Hambaly, Setiawati, & Majid, 2018)

Ergonomic hazards based on the risk assessment and existing staff, are found in the form of fatigue when carrying goods from the 1st floor to 4th floor or vice versa. Complaints of back pain, shoulder and sprains / dislocations are the most common complaints caused by this activity. In some rooms, there are complaints in the form of a table mismatch with chairs, tables that are too high and chairs that cannot adjust, causing fatigue in the limbs involved (hands, a 16)s, back and legs). Sitting and typing for a long time and manual handling can cause musculoskeletal disorders, such as low back pain. This is in accordance with the results of research conducted by Dewi (2017) that unnatural work posture for a long time will cause complaints of pain in body parts, fatigue, product defects and even physical defects.

The biological hazard that occurs as a result of contact with body fluids is needle stick injury which can be a big problem if the used needle contains pathogenic microorganisms, such as hepatitis or HIV. The most staffs at risk here are laboratory assistants in the nursing laboratory. Another biological hazard is air pollution, where the exposure comes from rooms that use air conditioning. Non-routine air conditioning treatment will cause the air to contain microorganisms and cause respiratory diseases, such as work-related asthma (Sujoso, 2012). The presence of vector animals (cockroaches and rats) as well as cats in the work area will also affect the cleanliness and health of workers. The identified psychosocial hazards are the setting of working and rest hours which are actually in accordance with standards, but it has not applicated yet, especially the extra attention for night shift workers related to the schedule of changing shifts. Workload exceeds the work capacity of some staff will cause decreased or poor work performance. Work done in a monotonous manner will also lead to boredom, which in turn leads to a decrease in worker productivity. Researcher's recommendations related to psychosocial hazards are reviewing work hours and rest time arrangements, reviewing work productivity, dividing work in order the workload is evenly distributed among all staff so that no one feels the burden is heavier than others and provides education to workers regarding safety and occupational health (Simbolon, 2018).

Environmental hazards at Muhammadiyah University of Jember exist in several work units located on the 4th floor, where the height is a source of danger that affects musculoskeletal disorders. Working at a height requires preventive action so that all work activities can be carried out safely, so risk management / risk management is

needed (HSE, 2017). To avoid musculoskeletal disorders, workers should pay attention to posture when going up and down stairs.

Based on the results of the risk assessment, there are 6 high-risk activity processes, 13 medium-risk 15 tivity processes and 4 low-risk activity processes. Evaluation needs to be done whether the existing risk is acceptable or not, referring to the risk criteria established by the management of the organization. Acceptable risk is often termed as low as reasonably practicable, where the lowest level of risk is reasonable (Ramli, 2013). The risks are found within acceptable limits, so control measuas must be taken.

The risk control is carried out for all hazards which are found in the hazard identification process by considering the risk ratings to determine the control priorities. Possible risk controls are engineering, administrative and personal protective equipment. This is in line with the theory of risk control that needs to be done to minimize and / or eliminate the risk of work accidents through the stages of elimination, substitution, engineering, administrative and personal protective equipment (Ramli, 2013).

CONCLUSION

Hazard identification in 11 activity processes in the general administration unit are found 21 potential hazards. In the laboratory unit, there are 6 activity processes with 11 potential hazards and in the personnel unit, 6 activity processes with 9 potential hazards are found.

There is the risk assessment in the work unit of the general administration division with a risk rating of 16, which is the activity of maintaining security in the campus environment that inherent in security duties. The highest risk rating with a value of 12 in laboratory units is found in nursing laboratories, namely in the process of preparing practicum activities using sharp tools / objects. While the risk assessment in the personnel unit, the highest risk rating with a value of 12 was found in working in the room using air conditioning and also in writing / typing on computers.

Risk control is determined based on the risk categories. The red zone is a high risk that must be controlled by eliminating the risk of hazards. Yellow zone where the risk is acceptable if security has been implemented and the green zone does not need control, but still adheres to SOP and the use of personal protective equipment. Implementing a work safety and health sys 101 that has been accommodated in Permenkes No. 48 of 2016 concerning office safety and health standards, including occupational safety, occupational health, office work environment health and office ergonomics.
