ABSTRAK

*KAI Access sebagai wadah dalam melayani pembelian tiket kereta api secara online tak luput dari kekurangan serta kepuasan pelanggan. Ulasan yang diberikan pelanggan pada aplikasi KAI Access pun beragam. Penelitian ini berisikan analisis sentimen terhadap data ulasan yang telah ditulis pelanggan terhadap aplikasi KAI Access pada Google Play Store dengan total data penelitian sebanyak 7500 ulasan. Metode yang digunakan dalam analisis ini adalah Multinomial Naive Bayes. Pembagian data dilakukan dengan porsi 20% data uji dan 80% data latih. Pada pemodelan dilakukan pengujian silang menggunakan metode *K Fold Cross Validation* dengan nilai k = 2, 3, 4, 5, 6, 8 dan 10. Hasil pemodelan menunjukkan, fold 10 memiliki rata-rata akurasi terbaik dengan nilai 88.87%, rata-rata presisi dengan nilai 91.73%. dan rata-rata *recall* dengan nilai 84.60%. Pada pengujian data uji validasi diperoleh hasil akurasi 89%, presisi 92% dan *recall* 85%. Dari pengujian validasi menunjukkan peningkatan performa dari pemodelan yang dilakukan. Hal ini menunjukkan bahwa metode Multinomial Naive Bayes memiliki kelayakan yang baik untuk implementasi penelitian ini.*

ABSTRACT

KAI Access as a place to serve train ticket purchases online is not without its shortcomings and customer satisfaction. The reviews given by customers on the KAI Access application also vary. This study contains a sentiment analysis of review data that has been written by customers on the KAI Access application on the Google Play Store with a total research data of 7500 reviews. The method used in this analysis is Multinomial Naive Bayes. The distribution of data is carried out with a portion of 20% test data and 80% training data. In the modeling, cross-testing was carried out using the K Fold Cross Validation method with values of $k = 2, 3, 4, 5, 6, 8$ and 10. The modeling results show that fold 10 has the best average accuracy with a value of 88.87%, the average precision with a value of 91.73%. and the average recall with a value of 84.60%. In testing the validation test data, the results obtained are 89% accuracy, 92% precision and 85% recall. From the validation test, it shows an increase in the performance of the modeling carried out. This shows that the Multinomial Naive Bayes method has a good feasibility for the implementation of this study.
