The Effect of START (Simple Triage And Rapid Treatment) Health Education on the Ability to Perform Natural Disaster Triage at the KSR Unit of the University of Muhammadiyah Jember

Abstract

Health education is a planned process for individuals to continuously learn to improve awareness and increase their knowledge and skills for the benefit of health. The purpose of the study was to determine the effect of START (Simple Triage And Rapid Treatment) triage education on the ability to triage natural disasters at KSR Unit Muhammadiyah University of Jember. The type of research design is pre experimental design, pre post test one group design. The sample of this study consisted of 40 samples, using purposive sampling technique. The research location was in PMI Jember Regency in August 2022. The data collection tools were observation sheets and checklists using the Wilcoxon statistical test. The results of this study showed the effect of START triage health education on the ability to triage natural disasters, with a p-value of 0.0001 (<0.005), meaning that H1 was rejected. The recommendation of this research is the selection of disaster respondents, namely mature age > 30 years who have a lot of experience. Taking male respondents rather than female respondents because it is possible for men to handle emergency problems requires stronger, agile, fast and precise personnel in making decisions, especially this Triage START.

Key words: Health Education, START Triage, Natural Disaster Triage.
