Hubungan Usia dan Status Paritas Ibu dengan Kepatuhan *Antenatal Care* Pada Ibu Hamil di Wilayah Kerja Puskesmas Jenggawah Kabupaten Jember

xv + 68 hal + 1 bagan + 9 tabel + 9 Lampiran

Abstrak

Antenatal care berguna untuk mendeteksi dini terjadinya resiko tinggi terhadap kehamilan dan persalinan sehingga dapat menurunkan angka kematian ibu dan memantau keadaan janin. Kepatuhan angka kunjungan ANC dipengaruhi oleh usia dan status paritas ibu hamil. Tujuan penelitian ini untuk mengetahui hubungan usia dan status paritas dengan kepatuhan kunjungan antenatal care pada ibu hamil di wilayah kerja Puskesmas Jenggawah Kabupaten Jember. Metode penelitian yang digunakan adalah *cross sectional study*. Populasi dalam penelitian ini menggunakan data kepatuhan ibu hamil trimester 3 di wilayah kerja Puskesmas kecamatan Jenggawah yakni sebanyak 51 orang berlangsung selama 3 bulan dengan jumlah sampel sebanyak 40 ibu hamil. Teknik pengambilan sampling pada penelitian ini menggunakan teknik *cluster random sampling*. Hasil penelitian menunjukkan *p value* uji *spearman rho* $0,000 < 0,05$, dengan demikian dapat diartikan bahwa terdapat hubungan usia dengan kepatuhan *Antenatal Care* pada ibu hamil di Wilayah Kerja Puskesmas Jenggawah Kabupaten Jember. Serta diketahui *p value* uji *spearman rho* $0,03 < 0,05$, dengan demikian dapat diartikan bahwa terdapat hubungan status paritas dengan kepatuhan *Antenatal Care* pada ibu hamil di Wilayah Kerja Puskesmas Jenggawah Kabupaten Jember. Semakin dewasa seseorang, maka cara berfikir semakin matang dan teratur melakukan *antenatal care*. Selain itu, semakin tinggi paritas pada ibu maka semakin tinggi pula resiko kematian maternalnya, maka dari itu ibu hamil termotivasi dalam memeriksakan atau melakukan kunjungan ANC secara teratur.

Kata kunci : Usia, Paritas, *Antenatal care*, *Ibu hamil*

The Relationship between Maternal Age and Parity Status and Compliance with Antenatal Care in Pregnant Women in the Jenggawah Health Center Working Area, Jember Regency

xv + 68 things + 1 chart + 9 tables + 9 Appendices

Abstract

Antenatal care is useful for early detection of high risks of pregnancy and childbirth so that it can reduce maternal mortality rates and monitor the condition of the fetus. Compliance with ANC visit rates is influenced by the age and parity status of pregnant women. This study aimed to determine the relationship between age and parity status and compliance with antenatal care visits among pregnant women in the Jenggawah Community Health Center working area, Jember Regency. The research method used is a cross-sectional study. The population in this study used data on compliance of pregnant women in the third trimester in the work area of the Jenggawah sub-district health center, namely 153 people for 3 months with a sample size of 111 pregnant women. The sampling technique in this study used a cluster random sampling technique. The research results showed that the p-value of the Spearman rho test was $0.000 < 0.05$, thus it could be interpreted that there was a relationship between age and compliance with Antenatal Care among pregnant women in the Jenggawah Health Center Working Area, Jember Regency. It is known that the p-value of the Spearman rho test is $0.03 < 0.05$, thus it can be interpreted that there is a relationship between parity status and Antenatal Care compliance among pregnant women in the Jenggawah Community Health Center Working Area, Jember Regency. The more mature a person is, the more mature their way of thinking is and they regularly carry out antenatal care. Apart from that, the higher the mother's parity, the higher the risk of maternal death, therefore pregnant women are motivated to have regular check-ups or ANC visits.
