Hubungan Peran Tenaga Kesehatan dengan Kemampuan Identifikasi Risiko Kehamilan Pada Ibu Hamil Trimester III di Wilayah Kerja Puskesmas Ajung Kabupaten Jember

xviii + 84 hal + 21 tabel + 2 Gambar + 6 lampiran

### Abstrak

Secara profesional tenaga kesehatan dalam praktek klinik mempunyai peran menurunkan angka kematian ibu. Tenaga kesehatan merupakan garda terdepan dalam mendeteksi kemungkinan risiko. Penelitian ini bertujuan untuk mengetahui hubungan peran tenaga kesehatan dengan kemampuan identifikasi risiko kehamilan pada ibu hamil trimester III di Wilayah Kerja Puskesmas Ajung Kabupaten Jember. Penelitian ini menggunakan design *cross sectional*. Populasi pada penelitian ini adalah ibu hamil trimester III di wilayah kerja Puskesmas Ajung Kabupaten Jember dengan melibatkan sebanyak 66 partisipan. Partisipan dipilih menggunakan teknik *purposive sampling* yang memenuhi kriteria inklusi. Data diambil menggunakan kuesioner. Data dianalisis menggunakan uji *Spearman Rho*. Hasil penelitian menunjukkan pada ibu hamil trimester III teridentifikasi bahwa peran tenaga kesehatan jumlah terbanyak adalah kategori kurang (51,5%), memiliki kemampuan identifikasi risiko kehamilan dengan jumlah terbanyak pada kategori kurang (53,0%). Analisis bivariate menunjukkan secara signifikan terdapat ada hubungan peran tenaga kesehatan dengan kemampuan identifikasi risiko kehamilan pada ibu hamil trimester III ( $p\text{-value} = 0,0001$ ;  $\alpha = 0,05$ ;  $r = 0,805$ ). Temuan ini memberikan bukti bahwa secara independen peran tenaga kesehatan yang optimal akan disertai dengan kemampuan identifikasi risiko kehamilan yang baik pada ibu hamil. Kolaborasi timbal balik antara ibu dan tenaga kesehatan dengan memberikan konseling manajemen risiko berkualitas tinggi dapat mengarah pada pemilihan strategi manajemen risiko yang efektif

*The Relationship between the Role of Health Workers and the Ability to Identify Pregnancy Risks in 3<sup>rd</sup> Trimester Pregnant Women in the Working Area of Ajung Health Center, Jember Regency*

*xviii + 84 pages + 21 tables + 2 pictures + 6 attachments*

### *Abstract*

*Professionally, health workers in clinical practice have a role in reducing maternal mortality. Health workers are at the forefront in detecting possible risks. This study aims to determine the relationship between the role of health workers and the ability to identify pregnancy risks in third trimester pregnant women in the Ajung Community Health Center Working Area, Jember Regency. This research uses a cross sectional design. The population in this study was third trimester pregnant women in the working area of the Ajung Community Health Center, Jember Regency, involving 66 participants. Participants were selected using a purposive sampling technique who met the inclusion criteria. Data was taken using a questionnaire. Data were analyzed using the Spearman Rho test. The results of the study showed that in the 3<sup>rd</sup> trimester of pregnancy, it was identified that the role of the largest number of health workers was in the insufficient category (51.5%), with the ability to identify pregnancy risks with the highest number in the insufficient category (53.0%). Bivariate analysis shows that there is a significant relationship between the role of health workers and the ability to identify pregnancy risks in third trimester pregnant women ( $p\text{-value} = 0.000$ ;  $\alpha = 0.05$ ;  $r = 0.805$ ). These findings provide evidence that independently the optimal role of health workers will be accompanied by the ability to identify good pregnancy risks in pregnant women. Mutual collaboration between mothers and health professionals by providing high-quality risk management counseling can lead to the selection of effective risk management strategies*
