ABSTRACT

The purpose of this study was research that wanted to find out about the detection of teachers of special needs children (ABK) in Jember inclusion schools. This type of research is quantitative descriptive research. The variable of this research is the teaching regulation on the accompanying teacher of children with special needs. The population of the study was 50 inclusive teachers accompanying the inclusion class. The technique of taking samples using saturated sampling techniques. Data analysis method uses validity, reliability, normality, and analysis descriptions. Based on the results of the study, it determined the detection of companions of special needs children (ABK) in inclusive schools regarding the distribution of companions for registrants. This is measured by the relatively low cognitive assessment indicator and the re-realization expression is in the low category. These results indicate that testing the transition of accompanying teachers is still low. Logistics Regulations Regulate the Logic that is carried out by accompanying teachers in assisting children with special needs.
