Hubungan Dukungan Suami dengan Kejadian Preeklampsia pada Ibu Hamil Trimester III di Wilayah Puskesmas Singojuruh  
xv + 65 halaman + 12 tabel + 1 bagan + 15 lampiran

Abstrak

Dukungan emosi yang paling penting bagi ibu hamil biasanya adalah suaminya, banyak bukti bahwa wanita hamil yang di perhatikan dan dikasihi oleh pasangannya akan menunjukkan lebih sedikit gejala emosi dan fisik, lebih sedikit komplikasi persalinan. Kehamilan trimester III semakin banyak keluhan yang di rasakan oleh ibu baik keluhan bersifat psikis maupun fisik. Preeklamsia adalah hipertensi yang timbul setelah 20 minggu kehamilan disertai dengan proteinuria dan edema. Di Asia Tenggara kematian ibu yang diakibatkan oleh preeklampsia sebesar 17% dan di Indonesia sebesar 25%. Tujuan penelitian ini untuk mengidentifikasi hubungan dukungan suami dengan kejadian preeklampsia di Wilayah Puskesmas Singojuruh. Penelitian ini menggunakan metode *corellation research* dengan pendekatan *cross sectional*. Populasi dalam penelitian ini adalah seluruh ibu hamil trimester III berjumlah 50 orang. Teknik pengumpulan data menggunakan kuesioner dan lembar observasi. Analisis data menggunakan *Fisher Exact Test*. Didapatkan hasil *p value*  $0,004 < (\alpha 0,05)$  yang berarti ada hubungan dukungan suami dengan kejadian preeklampsia di Wilayah Puskesmas Singojuruh. Diskusi ini disarankan agar perawat di puskesmas dapat meningkatkan peran dalam upaya pengaplikasian intervensi dukungan suami pada ibu hamil.

Kata kunci: dukungan suami, preeklampsia, ibu hamil.

Relationship of Husband's Support with Preeclampsia in Trimester III Pregnancy Women is in the Singojuruh Health Center Area.

xv + 65 pages + 12 tables + 1 chart + 15 appendix

Abstract

The most important emotional support for pregnant women is usually her husband, there is much evidence that pregnant women who are watched and loved by their partners will show fewer emotional and physical symptoms, fewer labor complications. Third trimester of pregnancy the more complaints felt by the mother both psychological and physical complaints. Preeclampsia is hypertension that occurs after 20 weeks of pregnancy accompanied by proteinuria and edema. In Southeast Asia maternal mortality caused by preeclampsia is 17% and in Indonesia it is 25%. The purpose of this study was to identify the relationship between husband's support and the incidence of preeclampsia in the Singojuruh Health Center area. This study used the correlation research method with a cross sectional approach. The population in this study were all third trimester pregnant women totaling 50 people. The technique of collecting data using questionnaires and observation sheets. Data analysis using Fisher Exact Test. Obtained p value 0.004  $<(\alpha 0.05)$  which means there is a relationship between husband's support and the incidence of preeclampsia in the Singojuruh Community Health Center. This discussion is suggested that nurses in health centers can increase their role in efforts to apply husband support interventions to pregnant women.
