Relationship between Active Activity of Elderly People in Prolanis Activities and Stability of Blood Sugar Levels in Diabetes Mellitus Patients in Sumbersari Health Center, Jember, 2019.

Xvi + 115 pages + 1 figure + 21 Tables + 15 appendices

Abstract

Prolanis is a system of health services and a proactive approach that is implemented in an integrated manner involving participants, health facilities and BPJS Health in the context of maintaining Diabetes Mellitus (DM) in the elderly Prolanis family. Prolanis is formed to meet health needs and the occurrence of complications in Diabetes Mellitus. Control of blood sugar is one indicator of the quality of life of individuals with diabetes because good blood sugar control is one of the parameters of successful adjustment in lifestyle. The research method used is the Cross Sectional approach aims to determine the relationship of the activity of the elderly in prolanis activities with the stability of blood sugar levels in patients with Diabetes Mellitus in the Sumbersari Jember Health Center. The population in this study were 36 respondents. The sampling technique uses purposive sampling. The technique of collecting data uses an observation sheet and a Healthy Elderly Health book from the Puskesmas. The results of the activity analysis obtained the value of P Value: 0.002, which means that H1 was accepted there was a relationship between the activity of the elderly and the stability of blood sugar levels at the Sumbersari Health Center in Jember. There is a relationship between the activity of the elderly in prolanis activities and the stability of blood sugar levels at the Sumbersari Jember Health Center.
