Hubungan Kepatuhan Penerapan *Bundles Prevention* Flebitis oleh Perawat dengan Kejadian Flebitis di Ruang Rawat Inap RSD Balung Jember, 2021

xiii + 69 hal + 12 tabel + 2 gambar + 7 lampiran

Abstrak

Flebitis merupakan suatu komplikasi dari pemberian terapi intravena baik disebabkan oleh iritasi kimia, mekanik, bakteri maupun post infus yang ditandai dengan adanya kemerahan, nyeri, indurasi dan pembengkakan di daerah penusukan atau sepanjang vena. Kejadian flebitis dapat dicegah dengan penerapan *bundles prevention* flebitis. Kepatuhan penerapan bundles prevention flebitis dapat dipengaruhi oleh motivasi, sikap dan kemampuan perawat. Penelitian ini bertujuan untuk mengetahui hubungan kepatuhan penerapan *bundles prevention* flebitis oleh perawat dengan kejadian flebitis di ruang rawat inap RSD Balung. Penelitian ini menggunakan desain penelitian observasional analitik dengan pendekatan study kohort. Populasi dari penelitian ini adalah pasien yang akan dilakukan tindakan pemasangan infus. Teknik sampling yang digunakan menggunakan quota sampling sebanyak 35 pasien yang terpasang infus. Hasil penelitian dengan menggunakan uji fisher's exact test dengan nilai $p\ value = 0,007$, menunjukkan hubungan signifikan kepatuhan penerapan bundles prevention flebitis dengan kejadian flebitis di Ruang Rawat inap RSD Balung. Kesimpulan dari penelitian ini adalah kepatuhan penerapan bundles prevention flebitis oleh perawat berhubungan dengan kejadian flebitis di ruang rawat inap RSD Balung.

Relationship of Compliance with the Application of Phlebitis Bundles Prevention by Nurses with the Incidence of Phlebitis in the Inpatient Room of RSD Balung Jember, 2021

xiii + 69 pages + 12 tables + 2 pictures + 7 attachments

Abstract

Phlebitis is a complication of intravenous therapy either caused by chemical, mechanical, bacterial or post-infusion irritation which is characterized by redness, pain, induration and swelling in the puncture site or along the vein. The incidence of phlebitis can be prevented by implementing the bundles prevention of phlebitis. The compliance with the implementation of the bundles prevention phlebitis can be influenced by the motivation, attitudes and abilities of the nurses. This study aims to determine the relationship between compliance with the implementation of the bundles prevention phlebitis by nurses with the incidence of phlebitis in the inpatient room. This study used an analytic observational study design with a cohort study approach. The population of this study were patients who would undergo infusion. The sampling technique used was quota sampling of 35 patients who had an IV. The results of the study using fisher's exact test with p value = 0.007, showed a significant relationship between compliance with the application of the bundles prevention phlebitis with the incidence of phlebitis in the inpatient room of RSD Balung. The conclusion of this study is that compliance with the implementation of bundles prevention phlebitis by nurses is associated with the incidence of phlebitis in the inpatient room of RSD Balung.
