Pengkajian Keperawatan Dan Diagnosa Keperawatan pada Ibu Post *Sectio Caesarea* dengan Riwayat Bekas *Sectio Caesarea* (BSC) di Ruang Mawar RSUD dr. H. Koesnadi Bondowoso

xv + 117 halaman + 18 tabel + 06 lampiran

Abstrak

Sectio Caesarea (SC) merupakan tindakan pembedahan yang dapat menimbulkan berbagai masalah fisik dan psikologis pada ibu post partum. Penelitian ini bertujuan untuk mendeskripsikan hasil pengkajian keperawatan pada ibu post partum dengan Bekas *Sectio Caesarea* (BSC) di Ruang Mawar RSUD dr. H. Koesnadi Bondowoso. Metode yang digunakan adalah studi kasus deskriptif pada tiga ibu post partum pasca *Sectio Caesarea* yang dipilih secara purposive sampling. Pengumpulan data dilakukan melalui wawancara, observasi, pemeriksaan fisik, dan studi dokumentasi. Hasil pengkajian menunjukkan bahwa seluruh klien mengalami nyeri akut, gangguan mobilitas fisik, gangguan pola tidur, ansietas, dan risiko infeksi. Selain itu, ditemukan kesiapan peningkatan menyusui dan kesiapan peningkatan menjadi orang tua pada seluruh klien. Nyeri akut menjadi masalah utama yang memengaruhi mobilitas dan kenyamanan pasien. Hasil penelitian menunjukkan bahwa pengkajian keperawatan yang komprehensif mampu mengidentifikasi berbagai masalah dan kebutuhan pasien sebagai dasar dalam penyusunan asuhan keperawatan yang tepat dan berkelanjutan.

Nursing Assessment and Nursing Diagnosis in Post Caesarean Section Mothers With a History of Previous Caesarean Section (BSC) in the Rose Room of dr. H. Koesnadi Bondowoso Regional Hospital

xv + 117 pages + 18 tables + 06 appendices

Abstract

Sectio Caesarea (SC) is a surgical procedure that may cause various physical and psychological problems in postpartum mothers. This study aimed to describe the nursing assessment findings of postpartum mothers with Previous Sectio Caesarea (BSC) in the Mawar Ward of dr. H. Koesnadi Bondowoso Regional Hospital. This study employed a descriptive case study design involving three postpartum mothers following Sectio Caesarea selected through purposive sampling. Data were collected through interviews, observations, physical examinations, and documentation studies. The assessment results showed that all clients experienced acute pain, impaired physical mobility, sleep pattern disturbances, anxiety, and risk of infection. In addition, readiness for enhanced breastfeeding and readiness for enhanced parenting were identified in all clients. Acute pain was found to be the primary problem affecting patients' mobility and comfort. The findings indicate that comprehensive nursing assessment is able to identify various patient problems and needs, serving as a basis for planning appropriate and continuous nursing care.
